

As of 2018/09/30

Fund Objective and Strategy

This is a domestic income portfolio which seeks to provide investors with consistent positive returns and minimal volatility. The objective of the portfolio is to deliver real returns in excess of money market and traditional income portfolios over the medium to longer term.

Investors are mainly exposed to the fixed income and credit markets. The portfolio aims to optimize risk-adjusted returns by strategically allocating within the various sources of the fixed interest and credit universe according to current valuations. The portfolio will optimize the yield of the portfolio whilst compensating as far as possible for the underlying risk. This is done by focusing mainly on credit and yield enhancing strategies, whilst very moderate duration strategies are employed.

Given that the portfolio aims to deliver consistent positive returns, it is designed to be less volatile than traditional bond funds with significantly fewer negative monthly returns. The Manager shall seek to achieve this objective by investing in a portfolio of assets which will consist of a combination of interest-bearing securities including money market, bonds, unlisted loans, inflation linkers, listed property and preference shares as well as any other securities which are considered to be consistent with the portfolios objectives or any other securities the Act may allow from time to time.

The portfolio will be managed in accordance with regulations governing pension funds and CISCA.

Manager Annual Fee	0.57
Total Expense Ratio	0.61
Transaction Cost	—
Total Investment Charges	0.61
TER Measurement Period	01 April 2016 - 30 June 2018

Total Expense Ratio (TER) is the percentage value of the Financial Product that was incurred as expenses relating to the administration of the Financial Product. A higher TER does not necessarily imply a poor return, nor does a low TER imply a good return. The current TER may not necessarily be an accurate indication of future TER's.

Transaction Cost (TC) is the percentage value of the Financial Product that was incurred as costs relating to the buying and selling of the assets underlying the Financial Product. Transaction Costs are a necessary cost in administering the Financial Product and impacts Financial Product returns. It should not be considered in isolation as returns may be impacted by many other factors over time including market returns, the type of Financial Product, the investment decisions of the investment manager and the TER.

Total Investment Charges (TER + TC) is the total percentage value of the Financial Product that was incurred as costs relating to the investment of the Financial Product.

Risk Profile: Conservative

This portfolio suits the investor who is seeking stable income flows and aims to keep capital intact. This means that the portfolio is highly unlikely to experience negative returns, but equally will not experience excessive returns on the upside. The main sources of risk are credit risk, interest rate risk and liquidity risk. The portfolio is largely exposed to high quality corporates and banks with low interest rate risk. The portfolio is less volatile than traditional bond funds and is diversified across the income oriented asset classes such as cash, nominal bonds, inflation linked bonds and property.

Glossary Terms

Annualised Returns

Annualised return is the weighted average compound growth rate over the period measured.

Asset Allocation

Asset allocation is the percentage holding in different asset classes (i.e. equities, bonds, property, etc.). It is used to determine the level of diversification in a portfolio.

Capital Fluctuations (Volatility)

Volatility is a measure of 'risk' and refers to the extent to which the price of an investment or capital value fluctuates over a certain period of time. Funds with high volatility usually offer the potential for higher returns over the longer term than low volatility funds.

Cumulative Returns

Cumulative return is the total growth experienced over the period measured.

Derivatives

Derivatives are instruments generally used as an instrument to protect against risk (capital losses), but can also be used for speculative purposes. Examples are futures, options and swaps.

Distributions

The income that is generated from an investment and given to investors through monthly, quarterly, bi-annual or annual distribution pay-outs.

Diversification

This is a strategy designed to reduce risk within a portfolio by combining a variety of investments (or asset classes) such as equities, bonds, cash or property, which are unlikely to all move in the same direction at the same time. This is designed to reduce the risk (and protect against capital losses) within a portfolio. Diversification allows for more consistent performance under a wide range of economic conditions as it smoothes out the impact of negative market events. The positive performance of some investments or asset classes should neutralize the negative performance of others.

Financial Instruments

Derivatives also known as financial instruments (such as a future, option, or warrants) whose value derives from and is dependent on the change in value of an underlying asset (such as a commodity, currency, or security) to protect against risk (capital losses).

Fund Objective

The fund objective is the portfolio's core goal.

Fund Strategy

The fund strategy is the way that the fund is managed to achieve the fund objective.

Information Ratio

The Information Ratio measures the market risk-adjusted performance of an investment or portfolio. The greater a portfolio's Information Ratio, the better its risk-adjusted performance has been compared to the market in general.

Collective Investment Schemes

Collective Investment Schemes (CIS) (also called unit trusts) are portfolios of assets such as equities, bonds, cash and listed property, in which investors can buy units. They allow private investors to pool their money together into a single fund, thus spreading their risk across a range of investments, getting the benefit of professional fund management, and reducing their costs.

Market Capitalization

Market capitalization is the total value of the issued shares of a publicly traded company; it is calculated by multiplying the share price by the number of shares in issue.

Maximum Drawdown

The maximum drawdown measures the highest peak to trough loss experienced by the fund.

Participatory Interests

When you buy a unit trust, your money is pooled with that of many other investors. The total value of the pool of invested money in a unit trust fund is split into equal portions called participatory interests or units. When you invest your money in a unit trust, you buy a portion of the participatory interests in the total unit trust portfolio. Participatory interests are therefore the number of units that you have in a particular unit trust portfolio.

Sharpe Ratio

The Sharpe Ratio measures total risk-adjusted performance of an investment or portfolio. It measures the amount of risk associated with the returns generated by the portfolio and indicates whether a portfolio's returns are due to excessive risk or not. The greater a portfolio's Sharpe ratio, the better its risk-adjusted performance has been (i.e. a higher return with a contained risk profile, where the portfolio manager is not taking excessive risk to achieve those returns).

Standard Deviation

Standard deviation (also called monthly volatility) is a measure of how much returns on an investment change from month to month. It is typically used by investors to gauge the volatility expected of an investment.

Additional Information

All reasonable steps have been taken to ensure the information on this MDD is accurate. The information to follow does not constitute financial advice as contemplated in terms of the Financial Advisory and Intermediary Services Act. Use or rely on this information at your own risk. Independent professional financial advice should always be sought before making an investment decision. The Sanlam Group is a full member of the Association for Savings and Investment SA. Collective investment schemes are generally medium- to long-term investments. Please note that past performances are not necessarily a guide to future performances, and that the value of investments / units / unit trusts may go down as well as up. A schedule of fees and charges and maximum commissions is available from the Manager, Sanlam Collective Investments (RF) Pty Ltd, a registered and approved Manager in Collective Investment Schemes in Securities. Additional information of the proposed investment, including brochures, application forms and annual or quarterly reports, can be obtained from the Manager, free of charge. Collective investments are traded at ruling prices and can engage in borrowing and scrip lending. Collective investments are calculated on a net asset value basis, which is the total market value of all assets in the portfolio including any income accruals and less any deductible expenses such as audit fees, brokerage and service fees. Actual investment performance of the portfolio and the investor will differ depending on the initial fees applicable, the actual investment date, and the date of reinvestment of income as well as dividend withholding tax. Forward pricing is used. The Manager does not provide any guarantee either with respect to the capital or the return of a portfolio. The performance of the portfolio depends on the underlying assets and variable market factors. Performance is based on NAV to NAV calculations with income reinvestments done on the ex-div date. Lump sum investment performances are quoted. The portfolio may invest in participatory interests of other unit trust portfolios. These underlying funds levy their own fees, and may result in a higher fee structure for our portfolio. All the portfolio options presented are approved collective investment schemes in terms of Collective Investment Schemes Control Act, No 45 of 2002 ("CISCA"). The Manager may borrow up to 10% the market value of the portfolio to bridge insufficient liquidity. The fund may from time to time invest in foreign instruments which could be accompanied by additional risks as well as potential limitations on the availability of market information. Investments in foreign instruments are also subject to fluctuations in exchange rates which may cause the value of the fund to go up or down. The fund may invest in financial instruments (derivatives) for efficient portfolio management purposes. The Manager has the right to close any portfolios to new investors to manage them more efficiently in accordance with their mandates. Excessive withdrawals from the portfolio may place the portfolio under liquidity pressures and in such circumstances a process of ring-fencing of withdrawal instructions and managed pay-outs over time may be followed. Management of the portfolio is outsourced to Granate Asset Management (Pty) Ltd, (FSP) Licence No. 46189, an Authorised Financial Services Provider under the Financial Advisory and Intermediary Services Act, 2002. Sanlam Collective Investments (RF) (Pty) Ltd retains full legal responsibility for the co-named portfolio. Standard Bank of South Africa Ltd is the appointed trustee of the Sanlam Collective Investments scheme. Sources of Performance and Risk Data: Morningstar Direct, INET BFA and Bloomberg. The risk free asset assumed for the calculation of Sharpe ratios: STEFI Composite Index. The highest and lowest 12-month returns are based on a calendar year period over 10 years or since inception where the performance history does not exist for 10 years. Obtain a personalised cost estimate before investing by visiting www.sanlamunittrustsmdd.co.za and using our Effective Annual Cost (EAC) calculator. Alternatively, contact us at 0860 100 266.

Granate SCI Multi Inc - Fund Commentary

Quarterly Commentary (30/09/2018)

Fund Profile

The Granate SCI Multi Income Fund is a domestic income portfolio which seeks to provide investors with consistent positive returns and minimal volatility. The objective of the portfolio is to deliver real returns in excess of money market and traditional income portfolios over the medium to longer term. Investors are primarily exposed to the fixed income and credit markets.

The portfolio aims to optimize risk-adjusted returns by strategically allocating within the various sources of the fixed interest and credit universe according to current valuations. The portfolio will optimize the yield of the portfolio whilst compensating as far as possible for the underlying risk. This is done by focusing mainly on credit and yield enhancing strategies, whilst very moderate duration strategies are employed. The portfolio is managed in accordance with regulations governing pension funds and CISCA.

Economic overview

Economic activity in major economies remained generally strong although there are some signs that growth momentum is slowing as the upswing is now in its 10th year and uncertainties around the impact of "trade wars", Brexit, and higher oil prices weigh on markets. These uncertainties have negatively impacted emerging markets as evident by a significant spike in market volatility and below-expectation data releases.

Domestic economic data for the 2nd quarter of 2018 (released during Q3 2018) showed that the economy is in worse shape than previously thought, having moved into recession for the first time since 2009. GDP contracted at a seasonally adjusted quarter-on-quarter annualised rate of 0.7% in the 2nd quarter, after recording a downward revised 2.6% contraction in the 1st quarter of 2018. 3rd quarter data has been mixed with retail and manufacturing growth improving while the mining sector slowed down meaningfully. Overall, however, economic growth is expected to improve in the 2nd half of the year, albeit to levels which are below potential.

The Monetary Policy Committee (MPC) of the Reserve Bank met twice during the 3rd quarter and kept the repo rate unchanged at 6.5%. While the repo rate was kept unchanged, the message delivered by the MPC has become progressively more hawkish as also evident by the fact that in its last meeting (September), 3 of the 7 members voted for a 0.25% rate hike. The MPC's decision has been made more difficult since the economy weakened by more than it had expected, while the currency depreciated by 11% between the two meetings. Therefore, it concluded that whilst the risks to inflation are to the upside (due mainly to external factors), demand pressures do not appear to pose a significant risk to inflation. Rising global policy rates, the weaker rand, higher petrol prices, stubbornly high administrative prices and prospects for stronger growth mean that policy rates will rise over the next 18 months with a high probability of a 0.25% increase in the repo rate by the end of the year.

Market overview

After a very poor 2nd quarter of 2018 for domestic bonds where the All Bond Index (ALBI) returned -3.8%, bond yields continued to rise, albeit at a much slower pace in the 3rd quarter with the yield on the benchmark R186 rising by 15.5 basis points (bps) and the ALBI returning 0.81%. The quarter was characterised by a significant spike in emerging market currency and bond volatility led primarily by concerns around Turkey's economic outlook and the risk that it may pose to emerging markets as evident by further selling of South African bonds by foreign investors.

Global bond yields also ended higher in the quarter (WGBI -0.92%) - yields on 10 year bonds rising in all developed markets excluding New Zealand. The rising yields in these markets was in line with major central banks either raising interest rates (US, UK, and Canada) or becoming more hawkish in their communication to the market. While emerging market bond yields did end the month higher in line with developed market bonds, they still managed to record a positive return (0.38%) due to their approximately 3.3% higher yield.

The inflation-linked bond curve continued to drift higher during the quarter with shorter dated maturities rising by more than longer dated ones in a sign that

investors are not overly concerned with a material increase in inflation over the near term.

The listed property sector remains a significant underperformer having recorded its 3rd consecutive negative quarter, this being the first time this has happened since 2004. The sector remains under pressure as economic growth continues to disappoint and the market being sceptical of companies' distribution policies and the ability to meet previous distribution growth expectations.

Portfolio activity

The Multi Income fund outperformed the bond market and the Stefi index for the quarter with a return of 1.71%, although due to the fund's duration position being slightly above neutral at 1.15, suffered marginally with the continual uptick of bond market yields. We continued to see value in bonds and increased our duration position to almost 1.3 during the quarter. We still favour fixed rate bonds over floating rate bonds and believe that the bond market is pricing in significant fiscal risk. On a real yield basis, longer dated fixed rate bonds are offering real yields in excess of 4%. The challenge is to not introduce too much interest rate risk into the fund whilst taking advantage of the steepness in the yield curve to keep the yield in the fund high.

With credit spreads continuing to narrow we are finding limited value in the credit market and are very much in favour of shortening our credit duration position. We will not be reinvesting extensively until we see better value in the credit market. On a risk adjusted basis we see better value in government bonds. The fund is positioned mainly in high quality credit with the banking sector still being our largest weight.

Listed property has continued to underperform and we reduced our exposure from 2.3% to 1.6% in the quarter. We have also reduced exposure to inflation linkers as we are not overly concerned with a material increase in inflation and are getting more attractive real yields from nominal bonds.

Portfolio positioning

With credit spreads having narrowed and looking more expensive, we are now actively looking for ways to enhance yield in the fund, besides reinvesting in credit. We have increased our government bond exposure in the form of the R186 and are looking at various structuring opportunities to keep the fixed rate exposure and our current duration position while enhancing the yield on these exposures to over 10%. Due to the volatility in the bond market and the steepness of the curve, we are also seeing value in embedding options into notes which enable an enhanced yield above a vanilla credit spread. We are extremely cautious in the credit market as we are seeing most primary auctions clearing below guidance and not pricing in the credit risks appropriately. This has extended into the secondary market as many corporate bonds, particularly in the banking sector, have repriced and are looking expensive. We will also remain cautious on the property sector and on a risk adjusted basis now do not believe that the sector is offering value. This is due to the fact that growth prospects for distributable income are extremely poor and are consistently being revised downwards. We are unlikely to upweight our property exposure, unless particular quality stocks have derated significantly. Inflation linked exposure in the fund will remain low in the fund as long as we believe nominals are compensating us more for inflation.

We will continue to keep the yield in the fund high while diversifying across different sectors and risk categories and being mindful of interest rate risk.

Portfolio Manager
